

700V 480mΩ SolidGaN with Si MOSFET Compatibility

1. Features

- 480mΩ E-Mode GaN with Built-In Gate Clamp
- 700V Continuous, 750V Pulsed Voltage Rating
- Wide 8V to 20V Gate Input Voltage Range
- Adjustable Turn-On and Turn-Off Slew Rate
- Drop-In Replacement for Si MOSFET
- Work with Si MOSFET Controllers and Drivers
- Zero Reverse Recovery Charge
- Short Circuit Protection with Built-In DESAT
- Available in TO220 FullPAK Package

2. Applications

- Boost PFC, QR Flyback Topology
- AHB, LLC Topology
- AC-DC Power Adaptor, LED Lighting
- TV Power, Home Appliance Power

3. Description

The ISG6137 SolidGaN IC seamlessly integrates a 700V enhanced mode Gallium Nitride (GaN) FET with a built-in gate clamp and DESAT protection in a conventional TO220 FullPAK package, establishing a new standard for performance, ease of use, and reliability in power electronics. It provides self-powered features without requiring a sustainable supply voltage for internal supply, ensuring consistent driving of integrated GaN FET. With built-in DESAT protection, the ISG6137 further ensures device robustness and system safety.

The ISG6137 offers the ability to adjust the turn-on slew rate of the GaN FET using an external gate resistor, allowing users to optimize efficiency and EMI performance. The ISG6137's high integration level with a GaN FET and robust protection makes it suitable for wide range of Si MOSFET applications with simple drop-in replacement.

15. Function Description

The ISG6137 SolidGaN IC in a TO220 FullPAK package contains high performance E-mode GaN FET with a built-in gate clamp and DESAT protection. It incorporates a self-powered feature without specified supply voltage for internal circuitry, converting supply either G or D pin corresponding its operation. This ensures consistent driving of GaN FET with easy-of-use and reliable operation.

The ISG6137 enables the independent adjustment of turn-on slew rate for driver by an external gate resistor, optimizing both EMI performance and efficiency. With the high integration level of GaN FET and robust protection, the ISG6137 offers a simple setup with a low component count, ensuring it is suitable for high-frequency and high-power applications.

Power-On-Sequence and Self-Powered Operation

The ISG6137 offers the self-powered feature without sustainable supply voltage for internal supply (VDD). It converts supply either G or D pin according to operation states to guarantee consistent driving of GaN FET.

Figure 14 shows the switching characteristics of the G and D. When the system is powered on, D pin is pulled high, the internal supply is powered from the D pin. The D voltage exceeding 30V is required for proper power supply typically. When G pin voltage goes above 4.0V, the internal GaN FET turns on with a time delay, t_{ON_PD} , and the D is pulled down to ground, powering the internal supply from G pin. When the G pin voltage goes below 4.0V, the internal GaN FET turns off with a time delay, t_{OFF_PD} .

Figure 14. Timing Diagram of Input and Output

Adjustable Turn-On and Turn-Off Slew Rate

The ISG6137 supports users the ability to adjust both turn-on and turn-off slew rate of the GaN FET independently. This is achieved by adding external gate resistors and diode between the driver output and G pin of ISG6137 as shown in Figure 15, targeting optimization of efficiency, reliability, and EMI performance.

Figure 15. Configuration of Adjustable Turn-On Slew Rate

DESAT Protection

The ISG6137 provides cycle-by-cycle DESAT protection by monitoring the drain-source voltage, V_{DS} , to protect the GaN FET from potential damage in the desaturation region. As illustrated in the timing diagram of Figure 16, when the V_{DS} exceeds the DESAT protection threshold (5.9V typical), the GaN FET is turned off. The GaN FET will be turned on again at the next rising edge of G signal. The blanking time of 600ns (typical) is added to prevent false triggering during the GaN FET turn-on.
